Large-scale genomic investigation of the gut microbiome on Parkinson's disease etiology - Code

Rodrigo Sandon

11/27/2021

Preprocessing GWAS Summary Datasets

The first step of this pipeline was to identify datasets we'd be performing our association studies on. Go to https://mibiogen.gcc.rug.nl/ to find the repository of datasets provided by Kurilshikov et. al, 2021 (https://pubmed.ncbi.nlm.nih.gov/33462485/). On this website, you'll find 6 links:

- 1. MBG.allHits.p1e4.txt -> top hit variants (p < 1e-4) for any level of the bacterial hierarchy
- 2. MiBioGen_QmbQTL_summary_phylum.zip (2.4 GB) -> summary statistics of bacterial phyla
- 3. MiBioGen_QmbQTL_summary_class.zip (4.4 GB) -> summary statistics of bacterial classes
- 4. MiBioGen QmbQTL summary order.zip (5.4 GB) ->summary statistics of bacterial orders
- 5. MiBioGen_QmbQTL_summary_family.zip (9.5 GB) -> summary statistics of bacterial families
- 6. MiBioGen_QmbQTL_summary_genus.zip (35.0 GB) -> summary statistics of bacterial genera

In our case, we wanted explore the bacterial genera taxanomy. In latter analyses, we hope to run family, order, class, and phylum taxanomies of bacteria. When you unzip the MiBioGen_QmbQTL_summary_genus.zip, it will look something like this:

- MiBioGen_QmbQTL_summary_genus:
 - genus.Clostridiuminnocuumgroup.id.14397.summary.txt.gz
 - $-\,$ genus. Eubacteriumbrachygroup.
id.11296.summary.txt.gz

Unzip the subfolders and you get a table like this:

bac	chr	bp	rsID	ref.allele	eff.allele	beta	SE	Z weighted	P weighted	N	Cohorts
name	5	71186626	$\mathrm{rs}6890185$	С	Τ	0.113	0.023	4.868	1.122e-06	4166	20

Now perform these data pre-processing steps (on sample data):

Import "reticulate" to incorporate python functionalities.

```
knitr::opts_chunk$set(tidy.opts=list(width.cutoff=80), tidy=TRUE)
library(reticulate)
use_virtualenv("base")
use_python("/Volumes/T7Touch/Applications/anaconda3/bin/python")
```

Each .gz file of the sum stats will give a txt file, convert these into csv files.

```
knitr::opts_chunk$set(tidy.opts=list(width.cutoff=80), tidy=TRUE)
sumstats_root <- "/Users/rodrigosandon/Documents/GitHub/ParkisonsMicrobiomeStudy/MB-PD_Association_Stud
source_python("Utilities.py")
out_paths <- txt_to_csv_files_in_root(sumstats_root)
# If this doesn't work, run the py file itself with the process execution</pre>
```

Add a "p" column to each sum stat csv file.

```
source python("Utilities.py")
knitr::opts_chunk$set(tidy.opts=list(width.cutoff=80), tidy=TRUE)
add_p_col_to_df <- function(bac_sumstat_path, new_col_name, out_path) {</pre>
  df <- read.csv(bac_sumstat_path, header = TRUE, sep = ",")</pre>
  df[new_col_name] <- 2*pnorm(-abs(df$beta/df$SE))</pre>
  eles_of_bac_path <- strsplit(bac_sumstat_path, "/")</pre>
  name_of_bac_sumstat <- eles_of_bac_path[[1]][length(eles_of_bac_path[[1]])]</pre>
  \# \hat{f}inding the name original name of the bac sumstat file
  new_name <- paste("addedP_", name_of_bac_sumstat, sep = "")</pre>
  new_path <- paste(out_path, new_name, sep = "")</pre>
  #print(new_path)
  # Export
  write.csv(df, new_path, row.names = FALSE, quote = FALSE)
}
create_lst_of_file_paths <- function(root_path, files_endswith_str) {</pre>
  files <- list.files(path = root_path, pattern = files_endswith_str, full.names = TRUE,
                       recursive = FALSE)
 return (files)
add_p_col_to_csvs_in_root <- function(root_path, out_path, files_endswith_str,
                                        new_col_name, omit_csvs_that_contain) {
  dir.create(out_path, showWarnings = FALSE) #uncomment if dir hasn't been created yet, else, keep comm
  files <- create_lst_of_file_paths(root_path, files_endswith_str)</pre>
  # Reminder: current files in the list should be in csv format
  for (bac_sumstat_path in files) {
    print(paste("Working on ...", bac_sumstat_path))
    start.time <- Sys.time()</pre>
    if (grepl(omit_csvs_that_contain, bac_sumstat_path, fixed = TRUE) == FALSE) {
      add_p_col_to_df(bac_sumstat_path, new_col_name, out_path)
    }
    end.time <- Sys.time()</pre>
    print(paste("Time to process: ", end.time - start.time))
 }
```

Polygenic Risk Score Analysis

do

Make a txt file of all of the genera you will be performing PRS on

```
#Identify the path where you've modified the sumstats
sumstats_path <- "/Users/rodrigosandon/Documents/GitHub/ParkisonsMicrobiomeStudy/MB-PD_Association_Study
#Define the group of files to identify within ^ this root path
look_for <- "addedP_"

#Identify path where you'll locate the txt file
txt_out <- "/Users/rodrigosandon/Documents/GitHub/ParkisonsMicrobiomeStudy/MB-PD_Association_Study_Pipe
source_python("Utilities.py")

files_lst <- find_paths_startswith(sumstats_path, look_for)
listdir_to_txt_file(files_lst, txt_out)</pre>
```

Using PRSice.R, perform PRS and acquire the output file

```
### Polygenic risk score analyses of 119 bacteria genuses versus PD risk

## Make a list of summary stats file
ls *csv > /Users/rodrigosandon/Documents/GitHub/ParkisonsMicrobiomeStudy/MB-PD_Association_Study_Pipeli

## Format these files
cat genuses.txt | while read LINE

do
    echo $LINE
    sed 's/\"//g' $LINE | sed 's/, / /g' > temp.txt
    awk '{print $0"\t"$2":"$3}' temp.txt | sed 's/chr\:bp/ID/' > $LINE.temp_formatted.txt
    rm temp.txt

done

## Identify independent risk SNPs using our in-house LD reference data for European populations (/data/
Rscript /data/LNG/pdMeta5v2/leaveOneOutPrsice/PRSice_linux/PRSice.R --cov-file /data/LNG/saraB/WGS/noag
Rscript /data/LNG/pdMeta5v2/leaveOneOutPrsice/PRSice_linux/PRSice.R --cov-file /data/LNG/saraB/WGS/noag
## Remove NeuroX individuals & extract nominated variants
cat genuses_formatted_list.txt | while read LINE
```

```
plink --bfile /data/LNG/saraB/concat_HARDCALLS_PD_september_2018_no_cousins --remove-fam NeuroX.txt --e.

## Make score files
cat genuses_formatted_list.txt | while read LINE
do
awk '{print $14, $6, $7}' addedPgenus.$LINE.summary.txt.csv.temp_formatted.txt | sed '1d' > $LINE.tosco
done

## Make sure score files have 3 expected fields rather than 2
cat genuses_formatted_list.txt | while read LINE
do
grep ":" $LINE.toscore.txt > true_$LINE.toscore.txt
done

## Calculate scores
cat genuses_formatted_list.txt | while read LINE
do
plink --bfile pruned_$LINE --score $LINE.toscore.txt --make-bed --out pruned_$LINE
done
```

Run PRS (logistic regression) in R

```
#install.packages("data.table")
library("data.table")

```

Including Plots

You can also embed plots, for example:

Note that the echo = FALSE parameter was added to the code chunk to prevent printing of the R code that generated the plot.
